

Forklift Fork Positioner

Forklift Fork Positioner - The fork positioner is actually a hydraulic apparatus that allows the the one driving to work the lift truck without leaving the seat. They are constructed out of high quality materials and are intended to be able to withstand the most difficult procedures and work environments. Side shifting models have the extra ability to laterally position the arms or the entire load in order to facilitate much more precise lifting and placement in a quicker and more effective method.

The unique fork pocket design could enable the person operating it to safely swing the unit's forks without any worry of destroying the positioning cylinders. This allows the operator the alternative to either perform independent or simultaneous blade movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are needed. Standard OEM carriages can be transformed into blade positioners on existing units.
